

What is Stormwater?

Water from rain and snow melt (stormwater) flows down our streets and into our stormwater systems, carrying pollutants with it. Stormwater systems discharge directly into our wetlands, streams, rivers and lakes. Stormwater is not treated at a facility.

STORMWATER POLLUTION PREVENTION

for Industrial Sites
a Best Management
Practices (BMPs)
Brochure

Stormwater Management Systems

The Town of Hudson, & Department of Environmental Protection requires stormwater management systems on many sites. Stormwater systems reduce some pollutants; however, these systems are not designed to treat sewage/septic flows, spills and dumped material. These pollutants are considered illicit discharges to the stormwater system. Implementing BMPs like the ones on this brochure help reduce, prevent, or eliminate illicit discharges.

Preventative Pollution Measures

Stormwater Pollution Prevention Plan

Create and implement a Stormwater Pollution Prevention Plan (SWPPP), which documents preventative measures to reduce or eliminate stormwater pollution in your operations.

Spill Prevention & Response Procedure

Establish procedures for staff to efficiently and consistently respond to possible spills.

Properly Use, Store & Cover Pollutants

Properly use, store, and cover the following potential pollutants:

- Trash and Debris
- Oil, Grease, and Fuels
- Fluids
- Chemicals
- Salt and other deicing agents
- Herbicide, Pesticide etc.

Check containers for leaks!

Parking Lot Sweeping

Sweeping your parking lot prevents stormwater pollution by removing particulate matter, including sediment and nutrients from paved surfaces.

Employee Training

Annually train all employees in stormwater pollution prevention measures and plans. New employees should be trained at the beginning of their employment.
